

## PRIOR AUTHORIZATION POLICY

**POLICY:** Complement Inhibitors – Fabhalta Prior Authorization Policy

- Fabhalta® (iptacopan capsules – Novartis)

**REVIEW DATE:** 12/11/2024

---

### OVERVIEW

Fabhalta, a Factor B inhibitor, is indicated for the following uses:<sup>1</sup>

- **Paroxysmal nocturnal hemoglobinuria (PNH)**, treatment in adults.
- Primary immunoglobulin A nephropathy (IgAN)**, for the reduction of proteinuria in adults at risk of rapid disease progression, generally a urine protein-to-creatinine ratio (UPCR)  $\geq 1.5$  g/g.

Fabhalta has a Boxed Warning about serious meningococcal infections.<sup>1</sup> Fabhalta is only available through a restricted access program, Fabhalta Risk Evaluation and Mitigation Strategy (REMS).

### Disease Overview

#### PNH

PNH is a rare, genetic disorder of hematopoietic stem cells.<sup>2,3</sup> The mutation in the X-linked gene phosphatidylinositol glycan class A (PIGA) results in a deficiency in the glycosylphosphatidylinositol (GPI) protein, which is responsible for anchoring other protein moieties to the surface of the erythrocytes. Loss of anchoring of these proteins causes cells to hemolyze and leads to complications such as hemolytic anemia, thrombosis, and peripheral blood cytopenias. PNH is a clinical diagnosis that should be confirmed with peripheral blood flow cytometry to detect the absence or severe deficiency of GPI-anchored proteins on at least two lineages.<sup>2,5</sup> Prior to the availability of complement inhibitors, only supportive management, in terms of managing the cytopenias and controlling thrombotic risk were available. Supportive measures include platelet transfusion, immunosuppressive therapy for patients with bone marrow failure, use of erythropoietin for anemias, and aggressive anticoagulation.

#### IgAN

IgAN is the most common primary glomerular disease in the world and it is the leading cause of CKD and kidney failure.<sup>5</sup> The disease is slowly progressive; approximately 25% to 30% of patients develop kidney failure within 20 to 25 years of presentation. The management of IgAN is focused on supportive care to slow the rate of disease progression. IgAN is characterized by a single histopathologic criterion of predominant or co-dominant IgA deposits on kidney biopsy, however, it is well recognized that the disease exhibits heterogeneity in clinical and pathological features. Hypertension and proteinuria are major risk factors for the progression of CKD. Guidelines from Kidney Diseases: Improving Global Outcomes (KDIGO) note that proteinuria reduction to  $< 0.5$  g/day, a surrogate marker of improved kidney outcomes in IgAN, is a reasonable target.

### Policy Statement

Prior Authorization is recommended for prescription benefit coverage of Fabhalta. All approvals are provided for the duration noted below. In cases where the approval is authorized in months, 1 month is equal to 30 days. Because of the specialized skills required for evaluation and diagnosis of patients treated with Fabhalta as well as the monitoring required for adverse events and long-term efficacy, approval requires Fabhalta to be prescribed by or in consultation with a physician who specializes in the condition being treated.

Automation: None.

### Recommended Authorization Criteria

Coverage of Fabhalta is recommended in those who meet one of the following criteria:

#### FDA-Approved Indication

Paroxysmal Nocturnal Hemoglobinuria. Approve for the duration noted if the patient meets ONE of the following (A or B):

Initial therapy. Approve for 6 months if the patient meets ALL of the following (i, ii, and iii):

Patient is  $\geq 18$  years of age; AND

Paroxysmal nocturnal hemoglobinuria diagnosis was confirmed by peripheral blood flow cytometry results showing the absence or deficiency of glycosylphosphatidylinositol-anchored proteins on at least two cell lineages; AND

The medication is prescribed by or in consultation with a hematologist.

Patient is Currently Receiving Fabhalta. Approve for 1 year if the patient meets ALL of the following (i, ii, and iii):

Patient is  $\geq 18$  years of age; AND

According to the prescriber, patient is continuing to derive benefit from Fabhalta; AND

Note: Examples of benefit include increase in or stabilization of hemoglobin levels, decreased transfusion requirements or transfusion independence, reductions in hemolysis, improvement in Functional Assessment of Chronic Illness Therapy (FACIT)-Fatigue score.

The medication is prescribed by or in consultation with a hematologist.

Primary Immunoglobulin A Nephropathy. Approve for the duration noted if the patient meets ONE of the following (A or B):

Initial Therapy. Approve for 9 months if the patient meets ALL of the following (i, ii, iii, iv, v, and vi):

Patient is  $\geq 18$  years of age; AND

The diagnosis has been confirmed by biopsy; AND

Patient is at high risk of disease progression, defined by meeting BOTH of the following (a and b):

Patient meets ONE of the following [(1) or (2)]:

Proteinuria  $\geq 0.5$  g/day; OR

Urine protein-to-creatinine ratio  $\geq 1.5$  g/g; AND

Patient has received the maximum or maximally tolerated dose of ONE of the following for  $\geq 12$  weeks prior to starting Fabhalta [(1) or (2)]:

Angiotensin converting enzyme inhibitor; OR

Angiotensin receptor blocker; AND

Patient has received  $\geq 3$  months of optimized supportive care, including blood pressure management, lifestyle modification, and cardiovascular risk modification, according to the prescriber; AND

Patient has an estimated glomerular filtration rate  $\geq 30$  mL/min/1.73 m<sup>2</sup>; AND

The medication is prescribed by or on consultation with a nephrologist.

Patient is Currently Receiving Fabhalta. Approve for 1 year if the patient meets ALL of the following (i, ii, iii, iv, and v):

Patient is  $\geq 18$  years of age; AND

The diagnosis has been confirmed by biopsy; AND

According to the prescriber, patient has had a response to Fabhalta; AND

Note: Examples of a response are a reduction in urine protein-to-creatinine ratio from baseline, reduction in proteinuria from baseline.

Patient has an estimated glomerular filtration rate  $\geq 30$  mL/min/1.73 m<sup>2</sup>; AND

The medication is prescribed by or on consultation with a nephrologist.

### Conditions Not Recommended for Approval

Coverage of Fabhalta is not recommended in the following situations:

Concomitant Use with Another Complement Inhibitor. There is no evidence to support concomitant use of Fabhalta with another complement inhibitor.

Note: Examples of complement inhibitors are Empaveli (pegcetacoplan subcutaneous injection), PiaSky (crovalimab-akkz intravenous infusion or subcutaneous injection), eculizumab intravenous infusion (Soliris, biosimilars), Ultomiris (ravulizumab-cwzy intravenous infusion), and Voydeya (danicopan tablets).

Coverage is not recommended for circumstances not listed in the Recommended Authorization Criteria. Criteria will be updated as new published data are available.
